

With the induction option it is possible to realize adhesion also on metallic components in one stable process step.

An appropriate control unit and an inductor manufactured individually for the respective project are applied. The casting tool is optimally adapted to this application with a specially developed modular design. This combination allows targeted heating of the components directly in the tool and adhesion can be achieved during the molding process without time-consuming pre- or post-processing.

The induction option can be integrated into **Flexline** machines and is designed individually for each project.

Optional induction consisting off:

- Control unit and transformer
- Individually designed inductor
- Special modular tooling for a targeted induction field
